Data Sheet

Description

Avago Technologies' MGA-16316 is an ultra low-noise high linearity amplifier pair with built-in active bias and shutdown features for balanced applications in the 2600 MHz band. Shutdown functionality is achieved using a single DC voltage input pin. High linearity is achieved through the use of Avago Technologies' proprietary GaAs Enhancement-mode pHEMT process^[1]. It is housed in a miniature 4.0 x 4.0 x 0.85 mm 16-pin Quad Flat No-lead (QFN). The compact footprint coupled with ultra low noise and high linearity makes MGA-16316 an ideal choice for basestation transmitters and receivers.

For applications < 1950 MHz, it is recommended to use MGA-16216 1440-2350 MHz or MGA-16116 450-1450 MHz. All 3 products share the same package and pin out configuration.

- The Fmin values are based on noise figure measurements at multiple input impedances using Focus source pull test system. From these measurements a true Fmin is calculated.
- Scattering and noise parameters are measured on coplanar waveguide made on 0.010 inch thick ROGER 4350. The input reference plane is at the end of the RFinput pin and the output reference plane is at the end of the RFoutput pin as shown in Figure 7.
- Idd can be obtained by varying the Vg1/Vg2. Refer to figure 7.
